

The beginning of the soil testing and water testing

pH 4.5 - Very Acid

NITROGEN, PHOSPHORUS & POTASH TESTS:
Fill a clean jar or can with 1 part soil and 5 parts water. Thoroughly shake or stir the mixture for at least one minute and then allow the mixture to stand undisturbed until it settles (30 minutes for sandy soil, 1 hour for loamy soil, 2 hours for clay soil). A fine clay soil will take much longer to settle out than a coarse sandy soil also vary, the clearer the better, however cloudiness will not affect the accuracy of the test.

Plant Food Chart

| | | | | |
|-------------|------|--------|-----|----------|
| Phosphorous | High | Medium | Low | Very Low |
| Nitrogen | High | Medium | Low | Very Low |
| Potash | High | Medium | Low | Very Low |

1. Remove the cap and allow the mixture to settle for 30 minutes.
2. Carefully pour the liquid into a clean test tube.
3. Cap the test tube and allow it to settle for 30 minutes.
4. Compare the results of the test to the chart for reference.

pH 5.0 - Very Acid

NITROGEN, PHOSPHORUS & POTASH TESTS:
Fill a clean jar or can with 1 part soil and 5 parts water. Thoroughly shake or stir the mixture for at least one minute and then allow the mixture to stand undisturbed until it settles (30 minutes for sandy soil, 1 hour for loamy soil, 2 hours for clay soil). A fine clay soil will take much longer to settle out than a coarse sandy soil also vary, the clearer the better, however cloudiness will not affect the accuracy of the test.

Testing the Nitrogen, Phosphorus, and Potassium that was in the water that we collected at the Harbor

Water sample results from the Harbor water. We tested the Iron, Copper, as well as the 6 tests that include the total hardness, total chlorine, Alkaline, pH, Nitrate, and Nitrite.
