

I will be researching the long term potential effects of eating disorder history on survivors in remission. I intend to review the research surrounding individuals with eating disorder histories and examine the resulting psychoses they often experience. I will be trying to figure out if being hospitalized contributes to or reduces distress for people with eating disorders overall, as well as how having an eating disorder as a teen affects the individual once they are in remission. I would like to help readers better understand the pros and cons of hospitalization for eating disorders, and gain a more nuanced perspective of what being in remission/ recovery actually means for someone with an eating disorder history.
